

## Scarf Joint Jig

The 3/8" x 3/4" piece on the underside of the jig is cut to fit your table saw miter slot. Overall length is not important; it just needs to be long enough to ride in the groove during the cutting of the scarf joint.

*Jig Top View*

The short and long pieces of wood on the top of the jig are put together at a 90° angle. The pieces are positioned to enable you to make a cut on the table saw that produces a sharp taper at the end of the cut while incorporating as much wood as possible along the length of the taper.
